

MST –II Syllabus for EE10510

Unit-I

Star-delta transformation, Superposition Theorem, Thevenin Theorem, Maximum Power Theorem and Norton's Theorem

Unit II

Generation of three phase voltages, star and delta connection, Line and Phase quantities, Three-phase power, Three-phase Power measurement techniques.

UNIT IV

Applications of diode as rectifier. Zener diode, its characteristics and its application as voltage regulator. Bipolar junction transistor (BJT), its characteristic in CE mode, Introduction to biasing techniques and use of BJT in power supply.

UNIT V

Number system, Binary codes, Boolean algebra, Boolean functions, logic gates
